

Tuesday 8th October

Modelling the digestive system

Digestion starts in the mouth. We put bananas and Weetabix in a bowl and crushed it up with a fork. The fork did the job of our teeth, grinding and crushing the food. Next we added

water. This was saliva. Saliva makes the food nice and soft - you can swallow it. Then to

the oesophagus. The oesophagus is a piping bag. We squeeze the food into the sealable freezer bag. The freezer bag was the stomach. The stomach

has stomach acid in it. We used green food colouring. We got bile from the liver, the bile was yellow food colouring. And then we got tights

the tights was the intestine. We cut a hole in the end of the tights. After that we squeezed it onto a plate which was the toilet. And then we ended up with firm solid faeces.
